Title: Reflector device for motor vehicle headlight

5 Inventor: Jean-François DELOURME

ABSTRACT

10 The present invention relates to a reflector device (300)
which provides for good ventilation of a light source
located in the said device and facilitates the passage of
the reflector device on production lines for the purpose of
covering an internal surface (310) of the reflector device
15 with powder. To this end, there is proposed according to
the invention a reflector device in which a reflector
element (301) and a lamp holder element (302) are produced
separately, prior to being interlocked. The reflector
element (301) produced thus comprises a set of supports
20 (303; 304; 305) which are arranged such that a light source
subsequently fitted in the reflector device (300) can be
ventilated in a satisfactory manner. The lamp holder
element (302) is interlocked with the reflector element
(301) on the supports by means of centering pins (316) and
25 assembly studs (317).
